

# First-time 2FA Setup via a Personal Computer

## Preliminary Actions

You need to install a *program* on your personal computer which will

- store the **secret key** that the IL authentication system will share with you
- calculate TOTP passcodes using the **secret key** as a seed

We advise Free Softwares such as [KeePassXC](#) (multiplatform with GUI) or the [OATH Toolkit](#) (GNU/Linux terminal), but you are free to choose any programs that implement the open OTP standards.

## Setup

### Step 1

Navigate to any of the Lorentz Institute SSO web applications, such [Account Services](#), [Remote Workspace](#), etc.

You will be redirected automatically to the Lorentz Institute Identity Provider login page as in **Figure 1**.

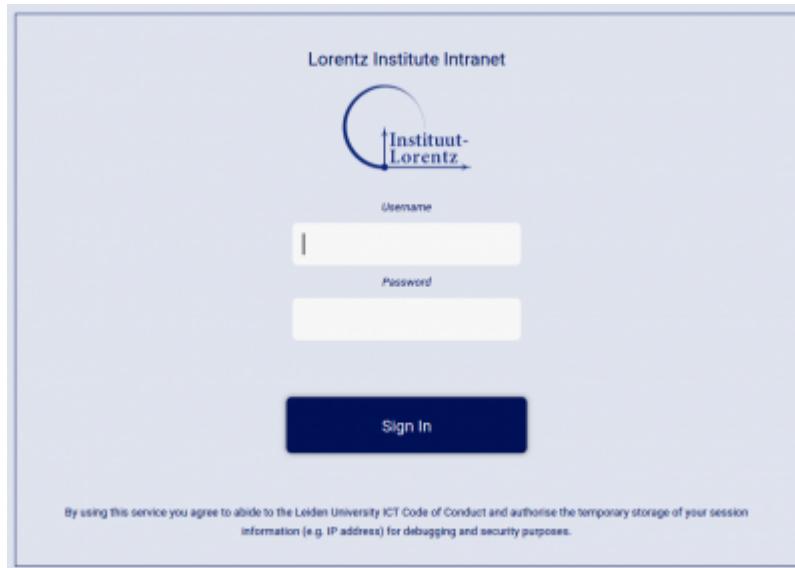

Figure 1: Identity Provider login page

### Step 2

Enter your IL credentials to sign in. Upon successful login, you will be redirected to a page containing a QR code. Click on “Unable to Scan?” to display your shared **secret key** and the other parameters to input in your OTP program to set it up (Figure 2).

Note the secret key, the algorithm, the number of digits, and the time interval. You will need them in Step 3.

The figure consists of two vertically stacked screenshots of a web page titled "Lorentz Institute Intranet". The top screenshot shows Step 1: "You need to set up Mobile Authenticator to activate your account." It asks to install one of the following applications: FreeOTP or Google Authenticator. Step 2: "Open the application and scan the barcode." A large QR code is displayed. Step 3: "Enter the one-time code provided by the application and click Submit to finish the setup." It includes fields for "One-time code" and "Device Name", both of which are blurred. A "Submit" button is at the bottom. The bottom screenshot is identical to the top one, showing the same three steps and blurred sensitive information.

Figure 2: TOTP Setup Page (QR code and other sensitive information deliberately blurred)

## Step 3

Open KeePassXC (installed on all IL workstations), create a new passwords database if you do not want to use an existing one and click on *Entries* → *TOTP* → *Set Up TOTP*. Insert your private key, algorithm, time interval and number of digits from Step 2 and confirm by clicking on 'OK'.

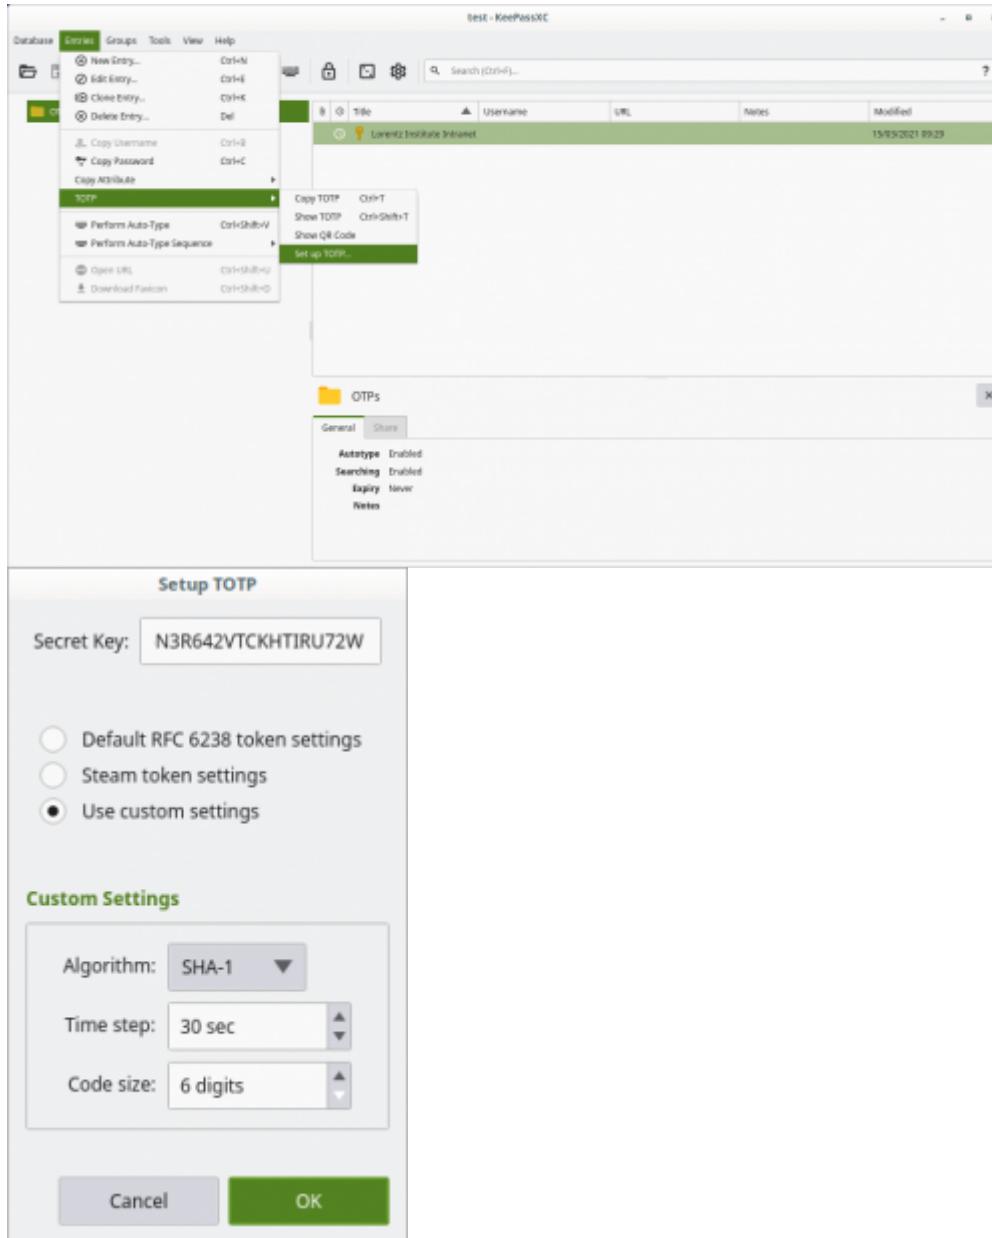

Figure 3: TOTP Setup with KeePassXC. Use the TOTP settings described in Step 2.

Generate a OTP by clicking on *Entries* → *TOTP* → *Show TOTP*. Insert this TOTP in the *One-time code* form input and, if you wish, a label in the form input called *Device Name*. This label is meant to help you keep track with which device the **secret key** has been shared. Click on *Submit*.

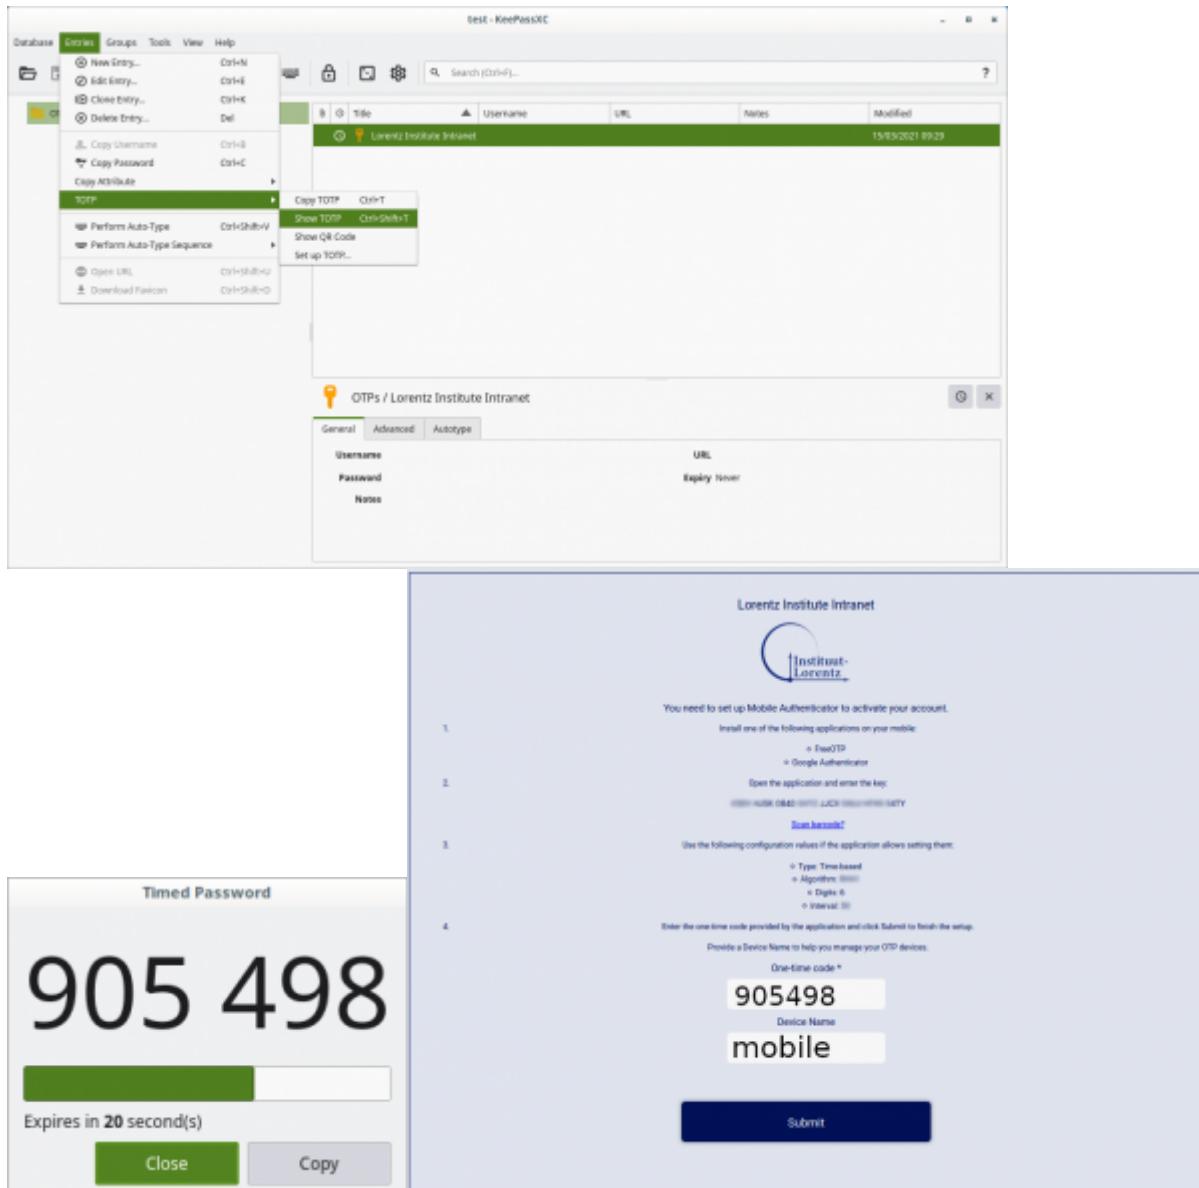

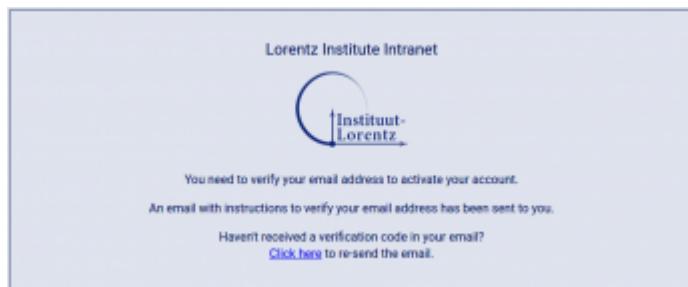

Figure 4: TOTP generation KeePassXC and final 2FA setup on the Lorentz Institute Identity Provider

## Step 4

If Step 3 succeeds (errors might occur if there is too much lag time, i.e. the OTP expired), the system will send you an email to your private (not @lorentz) e-mail address with [precise instructions](#) on how to verify your identity. If your identity cannot be validated, you will not be granted access to the system.

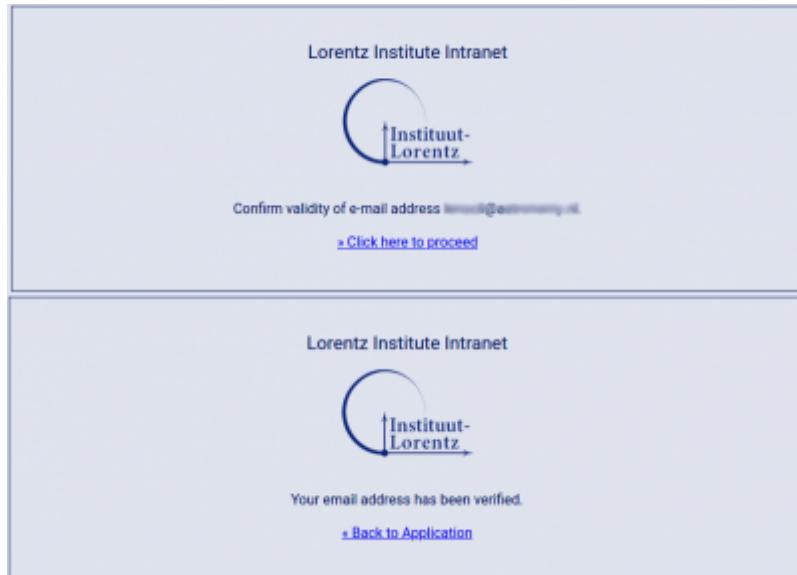

Figure 5: Screenshot of e-mail verification process.

## Step 5

Click on *Back to application* to redirect your browser to the Lorentz Institute SSO web application from which you started the whole process or close the browser. Your setup is complete.
