

Docking Station

You may find on some desks in the Observatory standard docking stations (ThinkPad) that can be used for any Windows, Mac or Linux based laptop, provided it has a USB-C connector. Our docking stations are connected to a keyboard, mouse, two screens, cabled internet and a power supply. You just have to connect your laptop using the available USB-C cable and boot it.

Setup screens

- Windows: you need to go to the settings -> Display where you can set your preferred screen orientations and layout.
- MacOS: you need to install the free package [DisplayLink Manager](#) once before you connect to the docking station. Follow the instructions to enable the software (System Preferences → Security)
- Linux: normally your window manager has a Display menu item in which you can set the layout and orientation of the different screens.

Remote Access

For details on how to access the Remote Desktop service:

- [STRW/LION Remote Desktop Services](#)
