

Remote Desktop Texel

The machine Texel runs as a Windows Remote Desktop Server to allow you to access Windows applications from a Linux/MacOS desktop.

Linux desktop

In order to access that server you need a standard Linux desktop installed package `xfreerdp`. Inside a Linux terminal you can type:

```
xfreerdp /v:texel /d:STERREWACHT
```

You will now be prompted with a for a Password, which is the one you use for logging in to the Linux desktop. After successful authentication you will be logged into the Windows server and see a new xwindow with in it a Windows desktop environment:

On its desktop you see icons for 'SAP Self Service', 'Planon' and the 'BestelPlein'. Click the appropriate icon to open the Edge IE compatible browser.

MacOS laptop/desktop

See <https://learn.microsoft.com/en-us/previous-versions/remote-desktop-client/remote-desktop-macos> for details on how to get/install remote desktop client on your Mac. Look at the 'Add a remote resource' section to add the Texel based parameters:

- Feed URL - `texel.strw.leidenuniv.nl`
- User name - Your Sterrewacht account name.
- Password - The password associated with your Sterrewacht account.
